

WHAT IS CLAIMED IS:

1. An electronic card, comprising two shells juxtaposed to each other,
and a frame mounted between the two shells, wherein:

the frame has two sides each formed with a locking groove, and each
5 of the two shells has two sides each formed with a locking hook detachably
locked in the respective locking groove of the frame.

2. The electronic card in accordance with claim 1, further comprising
a terminal seat mounted on a first end of the frame, wherein each of the two
shells has a first end formed with a bent edge rested on the terminal seat.

10 3. The electronic card in accordance with claim 2, wherein the
terminal seat has two sides each formed with an oblique insertion channel, and
the bent edge of each of the two shells is inserted into the respective insertion
channel of the terminal seat.

4. The electronic card in accordance with claim 1, wherein the frame
15 has a first end having two sides each formed with a positioning recess, and
each of the two shells has a first end having two sides each formed with a
positioning hook detachably locked in the respective positioning recess of the
frame.

5. The electronic card in accordance with claim 4, wherein the
20 positioning hook of each of the two shells is substantially L-shaped.

6. The electronic card in accordance with claim 4, wherein each of
the two sides of the first end of each of the two shells is formed with an

inclined edge located adjacent to the positioning hook, and each of the two sides of the first end of the frame is formed with two press faces each urged on the respective inclined edge of each of the two shells.

7. The electronic card in accordance with claim 1, further comprising
5 a circuit board mounted between the two shells and rested on the frame, and a terminal seat mounted on a first end of the frame and secured on a first end of the circuit board.

8. The electronic card in accordance with claim 7, wherein the first end of the frame is formed with an insertion recess, and the terminal seat is
10 inserted into the insertion recess of the frame.

9. The electronic card in accordance with claim 1, wherein the locking hook of each of the two shells is substantially L-shaped.

10. The electronic card in accordance with claim 1, wherein the locking groove of each of the two sides of the frame is formed with two spaced
15 elongated catch ribs for retaining the respective locking hook of each of the two shells.

11. The electronic card in accordance with claim 1, wherein each of the two shells has a symmetric structure.

12. The electronic card in accordance with claim 7, further
20 comprising an extension mounted on a second end of the frame and rested on a second end of the circuit board.

13. The electronic card in accordance with claim 12, wherein the extension includes a first casing mounted on the second end of the frame and a second casing removably mounted on the first casing, so that the circuit board is received in the extension between the first casing and the second casing.
